
Assembly Lube

Short Description

Assembly Lube

Description

This High Performance Assembly Lubricant, green in color, is a premium high viscosity lubricant specifically designed to offer additional protection during the engine assembly process. Its Pennsylvania Grade base oil provides higher load carrying ability and excellent surface film protection to prevent wear to components in highly stressed assembly applications. The product is readily miscible with all types of mineral based and synthetic engine oils. It does not contain solids such as molybdenum or graphite which can cause clumping and/or filter plugging, will not run or drip from treated parts due to its tacky/stringy nature and will protect assembled engines from rust and corrosion during the assembly period and shipping. It is recommended as a pre-lube for valve train components including cam lobes, lifters, wrist pins, rod bearings and main bearings.
